UJ/UC C-SAMS CONTROLLER 240V PLUGS AND SOCKETS

Since its introduction in 2000, the C-SAMs molding system has been successfully used with the Universal Joint and it continues to provide a highly reliable molding process.

During the life of any product, product changes are sometime imposed due to the discontinuation of parts. This bulletin provides insight and recommendations to the change of the 240VAC input connections (items with red circles in Figure 1) and their corresponding connector on the electrical supply cable.

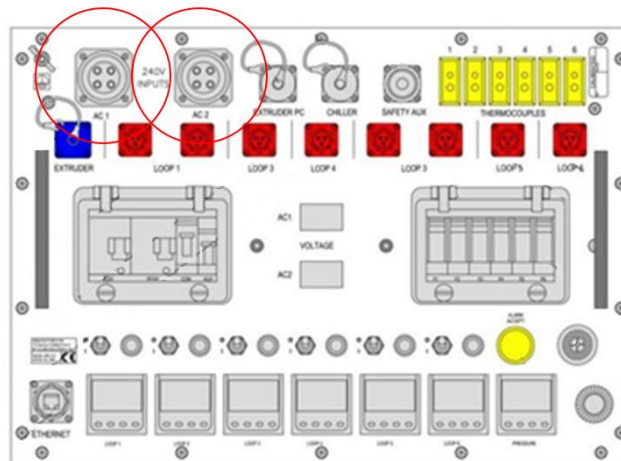

Figure 1 – 240v input sockets identified in red.

Due to differences in the connector, users are advised that the electrical supply cables for C-SAMs controllers prior to serial number 463 may not be interchangeable with subsequent units.

For information, controllers prior to serial number 463 were supplied with electrical supply leads to drawing number P06SS0807 and afterwards P10SS0441. However, this is only a guide as the controller may have been reworked and the connectors changed. The following is recommended:

- Regardless of the unit's serial number, physically check that the leads fit the controller before operational mobilization and ensure that these leads are retained with the unit.
- Take additional care of the cables and connectors. If either the cable or face panel connectors are damaged it may not be possible to obtain a replacement connector. In this case it will be necessary for the controller and cables be returned to base to be updated with the newer items.

If you have any queries concerning these changes, please contact the UJ Consortium Co-ordinator.
